

Drone generated data for skyline logging - which tree attributes are needed and which accuracy is possible

Course "Airborne Lidar and drone technology for forest inventory and management"

Agenda

- ▶ 1. Introduction
- ▶ 2. Methods
- ▶ 3. Results
- ▶ 4. Conclusions
- ▶ 5. Sources
- ▶ Questions

1. Introduction

Prof. Dr. M. Ziesak, P. Dietsch - Drone generated data for skyline logging

05.03.2019

3

1. Introduction

- State forest inventory of Switzerland (LF14b 2009-13):

¼ of the forest area is skyline logging area.

Harvesting system	Total		Sum
	%	±	%
Felling motor-manual, logging with mobile crane	4.1	0.3	24.7
Felling motor-manual, logging with conventional crane	7.1	0.4	
Felling motor-manual, logging with mobile crane, fully mechanised processing	9.1	0.5	
Felling motor-manual, logging with conventional crane, fully mechanised processing	4.4	0.3

1. Introduction

Logging method	Switzerland			
	1000m ³ /a	± %	%	±
skidder	3501	7	59.9	2.7
forwarder	1300	10	22.3	2.2
mobile crane	618	19	10.6	1.9
conventional cable crane	261	29	4.5	1.2
helicopter	151	31	2.6	0.8
other	10	63	0.2	0.1
total	5841	5	100	.

annual yield of live bole wood: main type of harvest · biogeographical region
 unit: % or 1000m³/a
 unit of evaluation: accessible forest excluding shrub forest NF11/NF12/NF13/NF14 combined
 grid: grid LFI4 2009 - 2013; change 2004/06-2009/13

Prof. Dr. M. Ziesak, P. Dietsch - Drone generated data for skyline logging

- ▶ With an assumed high productivity of 8 fm / h in cable crane operations this equals over 100'000 skyline logging PMH.
- ▶ Furthermore most of the unused wood potential is in cable yarding area. (BAFU 2015)

Cable yarding is important and will stay important.

7

1. Introduction

- ▶ Permanent need to increase the efficiency in cable crane operations
- ▶ Drone data are quickly available, precise and relatively cheap
- ▶ Therefore: 2 years project to examine the potential of drone data for skyline logging

Main objectives:

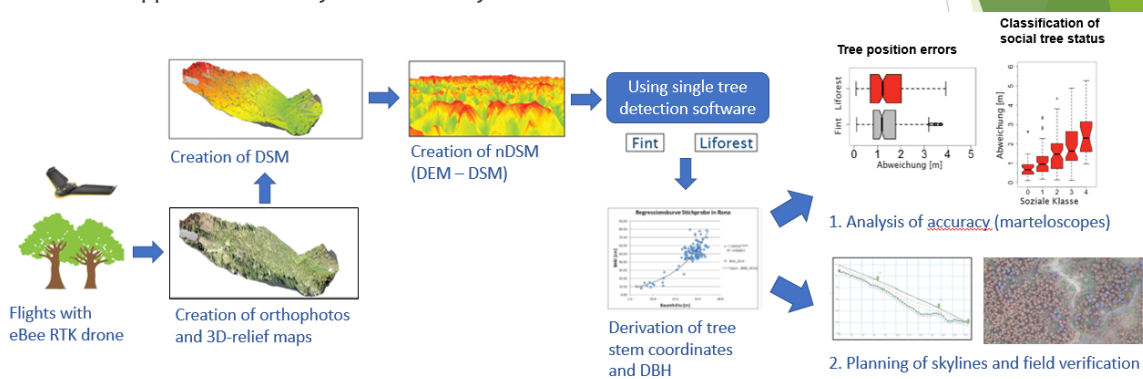

- ▶ to define the accuracy of coordinates and tree attributes created with drone data,
- ▶ to test the practicability of using drone data for planning skylines.

2. Methods

Methods - Overview

- Overall approach for analysis of accuracy and field verification

2. Methods - Overview

- ▶ The objective of the analysis of accuracy was to show that drone data are usable for skyline logging.
- ▶ With the field tests we planned to show the potential of drone data for silvicultural and forest operational planning processes.
- ▶ The drone used for both parts of the project was an eBee RTK drone with a 18.2 megapixel camera, high-precision GPS and eMotion flight software.

2. Methods - Analysis of accuracy

- ▶ We analysed the accuracy of tree stem coordinates first by using data from:
 - ▶ Classically terrestrial Marteloscope measurement
 - ▶ Position estimating by using drone data and:
 - ▶ FINT (ecorisQ)
 - ▶ an algorithm from RWTH Aachen
 - ▶ LiForest 2.1 (www.liforest.com)
 - ▶ IT-supported terrestrial measurements (localisation unit from RWTH Aachen)

Localisation unit (Source: Schluse 2016)

2. Methods - Analysis of accuracy

- ▶ The second part of the analysis of accuracy was to define accuracy of tree attributes (DBH, tree height, social status) by using:
 - ▶ Classically terrestrial marteloscope data
 - ▶ IT-supported terrestrial data (DBH)
 - ▶ Drone data and the following programs:
 - ▶ FINT (height, DBH)
 - ▶ LiForest 2.1

Prof. Dr. M. Ziesak, P. Dietsch - Drone generated data for skyline logging

05.03.2019

13

2. Methods - Field tests

- ▶ Done in 3 harvesting units.

The aim was to integrate the technique into the work flow, detect difficulties and opportunities.

- ▶ Sylvicultural point of view: can we identify forestry structural elements (gaps, regeneration etc.)?
- ▶ Forest operational point of view: are the logging lines and infrastructure trees locatable? (dimension, health status, position / distance to skyline).

17

3. Results - analysis of accuracy

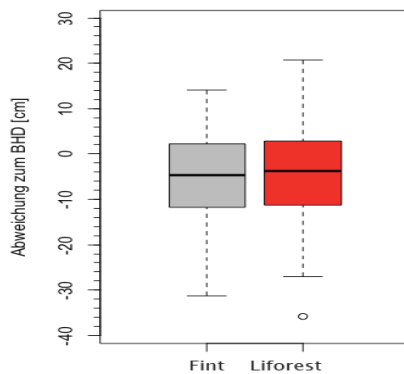

Difference between tree stem coordinates from classically terrestrial marteloscope measurement in marteloscope Williwald and results from FINT (grey) and LiForest (red) differenced in social tree categories.

Prof. Dr. M. Ziesak, P. Dietsch - Drone generated data for skyline logging

05.03.2019

18

3. Results - analysis of accuracy

DBH differences in marteloscope Williwald compared with classically terrestrial marteloscope measurement

- Because of very similar results we decided to only use FINT for the field tests.

3. Results - field tests

- It is possible to identify (with drone generated data):
 - anchor and intermediate support trees
 - these trees in the ground truth verification
 - silvicultural elements (stand level).
- It's not possible or difficult to recognise:
 - if trees are damaged or rotted;
 - the rooting system of trees
 - if there's regeneration under structured canopies.
- Other limitations may be restrict flight of drones: weather (like rain, heavy wind), legal restrictions.

3. Results - field tests (before & after cutting)

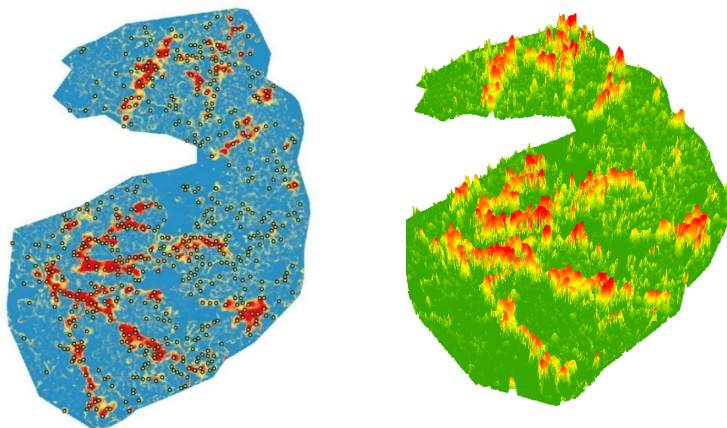

Field test area before and after cutting and logging.

Prof. Dr. M. Ziesak, P. Dietsch - Drone generated data for skyline logging

22

4. Conclusions

Prof. Dr. M. Ziesak, P. Dietsch - Drone generated data for skyline logging

05.03.2019

23

4. Conclusions

- ▶ The analysis of accuracy allows statements about the tree stem coordinates and DBH.
- ▶ It was possible to confirm the results with field tests. There is an added value by using drone data both for silvicultural and forest operational planning.
- ▶ For different reasons it's still necessary to verify the defined logging skylines in a field survey, but the procedure is expedited.
- ▶ With better basic data a better modelling would be possible (for example with a LiDAR drone or velodyne laser scanner).
